NEW – PERI UP Cladding

The safe and flexible enclosure system

PERI UP Cladding is a newly conceived, flexible enclosure system. It helps to achieve a spatial enclosure of the construction site, and is an easy to install and translucent protection for the construction site personnel and the surrounding area.

Specifications relating to noise and dust protection or an attractive outward appearance for building refurbishment, increasingly require effective enclosure of the construction site.

The overlapping elements of the cladding also increase protection for site personnel, as they protect against driving rain and strong sunlight, for example.

The opaque enclosure keeps onlookers out and can minimise the feeling of height. At the same time, it is translucent enough to create a bright working environment in daylight hours.

With only a few different components, the new cladding system is an ideal add-on to the PERI UP Scaffolding Kit and just as flexible as the kit itself – whether for simple facade scaffolding or more complex applications.

In combination with keder tarpaulins, the entire scaffold covering can be used for advertising purposes. Support rails with a rail keder are used for this purpose.

Efficient work processes

Thanks to the small number of different components and the fact they are easy to handle, assembly can be carried out efficiently right there on the existing PERI UP scaffold.

What's more, the extremely low individual component weight and the ability to carry out assembly from a secured position improve safety levels for the workers.

High degree of versatility

The panels can be installed and removed as flexibly as is mandated for a construction site – for example, it is possible to remove individual panels at a later stage without having to dismantle surrounding components.

High application diversity

PERI UP Cladding can be used in a highly versatile way: for cladding the complete scaffolding and even in connection with a supporting scaffold.

Lightweight panels with integrated handrail and multifunctional components facilitate easy handling on the construction site.

Due to the assembly from a secured position, PERI UP Cladding can be quickly and safely erected directly on the existing scaffold.

The system provides increased safety, as the assembly takes place inside the scaffold and individual panels are opened towards the inside.

Increased safety on the construction site

Overlapping panels provide visual and weather protection for the workers, as well as protecting the surroundings against noise and dust.

- Protection against typical construction site hazards, such as falling objects and dust
- Improved working conditions on the scaffold due to protection against rain and UV radiation
- Translucency creates a bright working environment in daylight
- Increases protection against burglary and theft
- Panels are flame retardant
